additive manufacturing academy
TO BOOST TRAINERS' COMPETENCES IN INDUSTRY

Summary

Industrialization of Additive Manufacturing

Project Number: 2021-1-IT01-KA220-VET-000033365

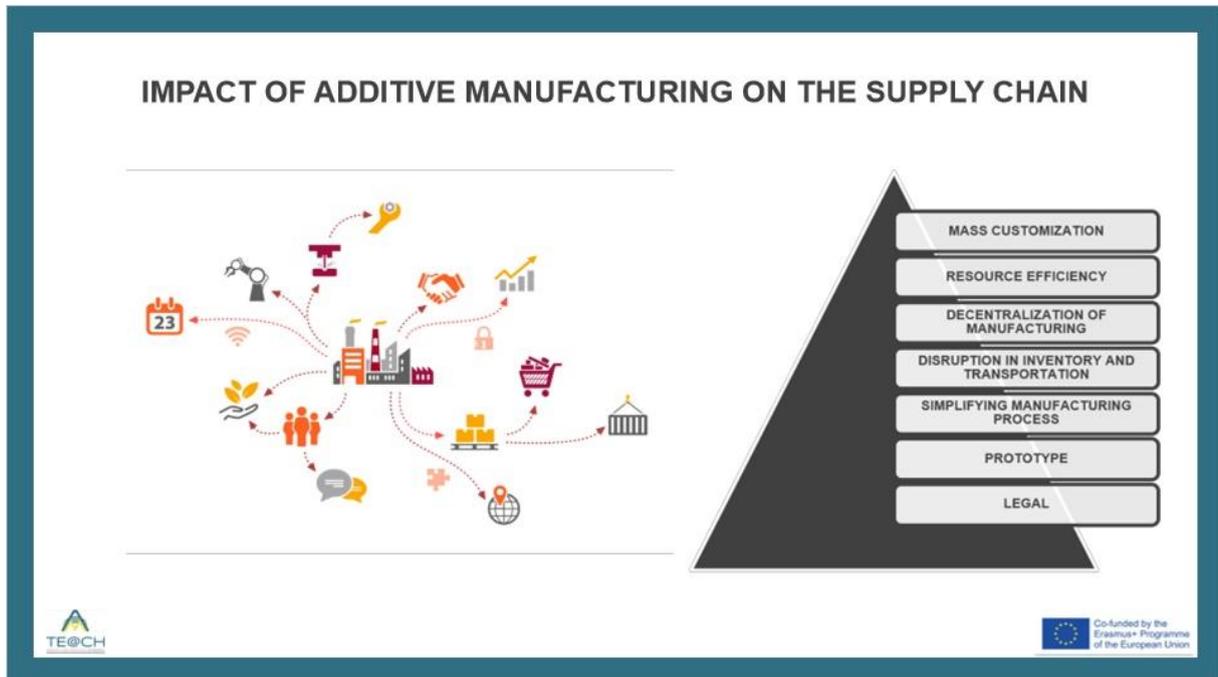

Course Content

The online course provides insights to the industrialization of Additive Manufacturing, delving into the transformation that AM is pushing across the supply chain and the evolution of Additive Manufacturing technologies.

Impact of AM on the supply chain

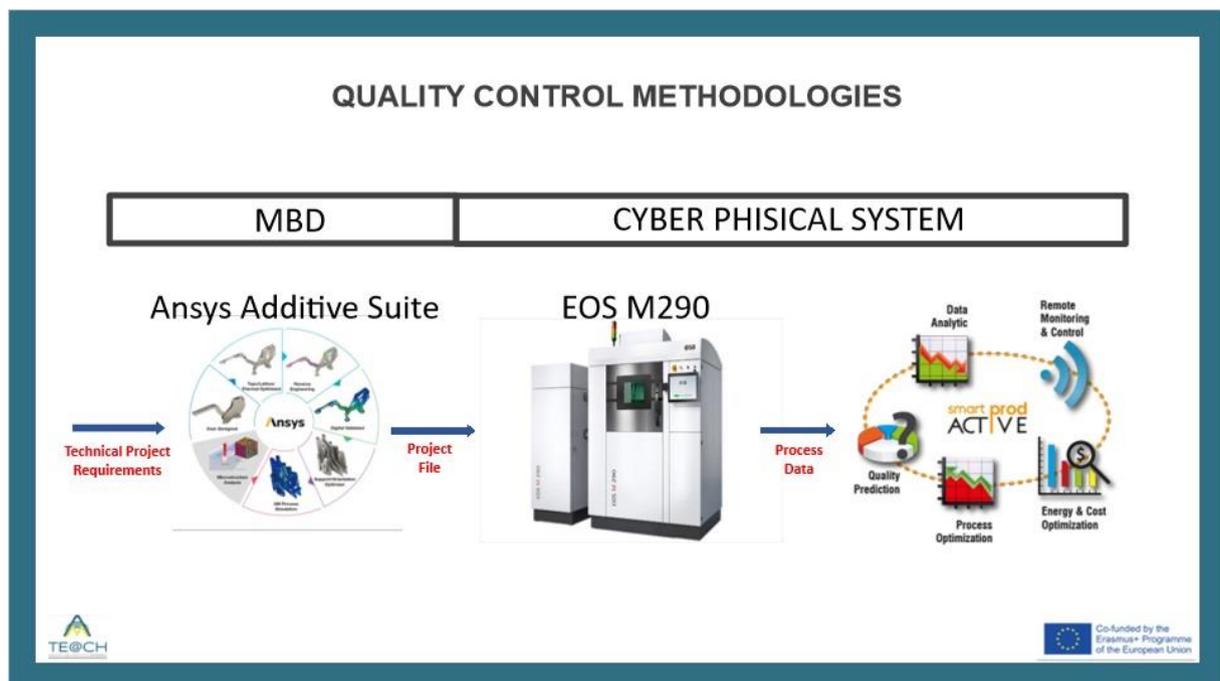

The Additive Manufacturing has the potential to disrupt the supply chain; therefore, the manufacturing industries must be prepared to adapt to a changing environment. In this scenario 7 key areas affected by AM are identified:

- **Mass customization:** faster time-to-market, increased flexibility and improved quality are some of the benefits that are achieved, along with challenges like slow production speeds and limited material options.
- **Resource efficiency,** in terms of reduced waste, efficient production of complex geometries, on demand production and reduced transportation emissions.
- **Decentralization of manufacturing** in combination with AM can enable production closer to the client, thus lowering transportation cost; also, it's a semi-automated process that does not require the same skills as conventional manufacturing.
- **Disruption in inventory and transportation** facilitate the production on location and on demand, removing the necessity of large warehouses to store

components.

- **Simplifying manufacturing process** by reducing the number of components per assembly and the number of processing steps needed for each component.
- **Prototype** production ease for innovative projects and updates on existing products.
- Legal concerns such as physical injury, intellectual property threat, product liability, product duplication and general security problems.

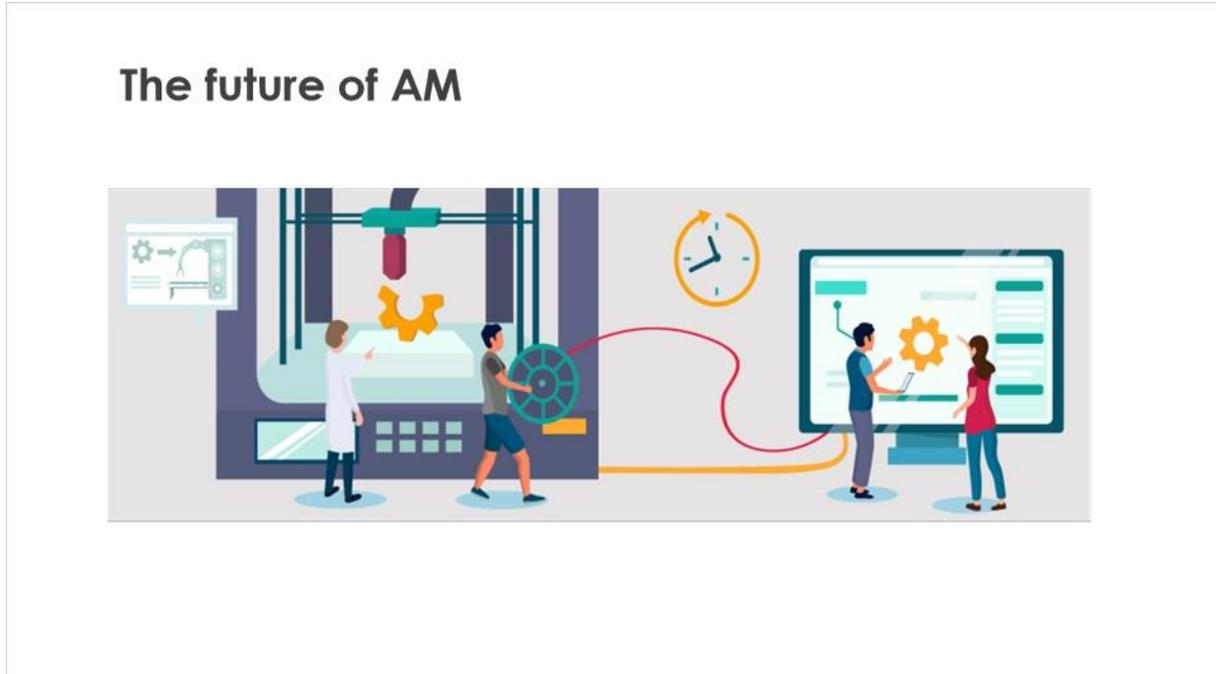

Quality control methodologies

A quality monitoring mechanism is required to boost the AM industry and improve the finished parts grade. Combining a 3D printer (Hardware) with a smart monitoring program (Software), a cyber-physical system is created.

In this way, it is possible to collect data that allow to develop predictive models capable of predicting the density obtained within the printed components.

Implementation of AM

Status and future of AM

As of today, AM finds applications in a broad range of fields of production, enabling all the advantages of the technology to be used. The sectors that benefit the most from AM are:

- **Manufacturing:** enhanced the process by enabling the production of complex parts and prototypes.
- **Aerospace,** where AM is used to produce lightweight and high-performance parts for aviation, defense, and space applications.
- **Healthcare:** AM enabled the production of customized medical devices and prosthetics.
- **Architecture and construction:** structural planes, façade elements and even whole buildings are manufactured in AM.
- **Education:** design, engineering and production skills are taught in schools and universities through AM.
- **Art and design:** used by designers and artists to produce complex sculptures.
